

CLAIMS

1. An apparatus, comprising:

a light source positioned on the head of the operator;

a first infrared sensitive receiver positioned proximate the light source;

a power supply to power the light source; and

an infrared source located remotely from the first infrared sensitive receiver, the first infrared sensitive receiver activated when the head of the operator points the first infrared sensitive receiver at the infrared source.

2. The apparatus of claim 1 further including a second infrared sensitive receiver positioned proximate the light source, the light source being dimmed when the first infrared sensitive receiver is activated by the infrared source and the light source being turned off when the second infrared sensitive receiver is activated by the infrared source.

3. The apparatus of claim 1 wherein the light source is toggled between bright and dim each time the infrared sensitive receiver is activated.

4. The apparatus of claim 1 wherein the light source is toggled between off and on each time the infrared sensitive receiver is activate.
